

CLONIDINE NOW AVAILABLE

At Bova we are always looking for novel treatment options for patients and we have been working on a new formulation.

Clonidine is a prescription medication used for treating certain behavioural disorders in dogs such as phobias, aggression, and separation anxiety. Generally, it is an effective agent when increased arousal or reactivity is a concern.

Clonidine is an alpha-adrenergic type medication that works by stimulating certain receptors in the brain.

Clonidine 300mcg chicken flavoured tablets are now available from Bova Aus.

Clonidine tablets are part of Bova's Quality Assurance Program.

The Bova Quality Assurance Program allows Bova's most commonly requested formulations to be assessed for quality, potency and stability before they are dispensed to our patients.
